# Netflix Streaming

[This problem may have been done in the class. Whatever the instructor taught you supersedes the following]

**Design a content streaming product like Netflix**

* How would you solve the problem of being able to stream different types of content simultaneously across millions of different types of device platforms with different network conditions (3G/4G/Wifi)?

* Aspects to think about : content ingestion, data serving, real time playback with QOS management

**Reading pointers:**
